ABSTRACT

METHODS FOR IDENTIFYING AND ISOLATING TISSUE-SPECIFIC LUMEN-EXPOSED MOLECULES

This invention provides novel methods of and kits for labeling and isolating

lumen-exposed molecules, particularly polypeptides which are expressed in a tissue-specific
or organ-specific manner. The methods and kits can be used to isolate molecules exposed on
the luminal side of cells lining vascular, ductal, sinus, respiratory, fascial, and other
perfusible tissue spaces.
